The Text Book Pulley

A problem that I encounter every day at school is unloading heavy text books from my backpack. My design, The Text Book Pulley, will make it easier to bring books from my locker to my classroom. Anyone could use this device. It would use 1 inclined plane, 12 horizontal pulleys, 1 bucket, and 12 hooks. This how it works.

My locker is in the hallway near my classroom. First, you need to press a black button that is in my locker. As soon as I press the black button an inclined plane will pop out of the locker. The book(s) slide out of the locker on the inclined plane and into the bucket. Then, a pulley will pop out. Next, I need to pull the blue string, which is located on the first pulley. That will make the pulleys start to move.
The bucket will be carrying the book(s). The bucket is linked onto a hook. The hooks are on the pulley system. Then, I have to continue to pull until the bucket is at my desk. My book(s) should get to my desk easier now.
